Introduction

Beginning in January 2005, the Florida Agency for Health Care Administration (Agency) began collecting information for all visits to a hospital Emergency Department (ED) in order to meet specific annual reporting requirements for ED utilization and costs. The resulting data provide a detailed look at the reasons people seek care at the ED, the charges and the payers for these visits, as well as the services performed in the ED setting.

Data reporting is necessary as EDs provide a significant source of urgent and non-urgent medical care in the state of Florida. In 2018, there were over 9 million outpatient ED visits. Over 64 percent (1,848,128 out of 2,854,118) of hospital inpatient admissions in the state of Florida originated in an ED facility.

The Agency submits this report in accordance with Section 408.062, Florida Statutes, which reads:

- (1) The agency shall conduct research, analyses, and studies relating to health care costs and access to and quality of health care services as access and quality are affected by changes in health care costs. Such research, analyses, and studies shall include, but not be limited to:*
 - (i) The use of emergency department services by patient acuity level and the implication of increasing hospital cost by providing non-urgent care in emergency departments. The agency shall submit an annual report based on this monitoring and assessment to the Governor, the Speaker of the House of Representatives, the President of the Senate, and the substantive legislative committees with the first report due January 1, 2006.*

Patient Characteristics

- *The largest portion of pediatric ED visits were made by children under five years of age.*

Around 38 percent of the nearly 2 million pediatric ED visits were for children four years old or younger. The number of pediatric ED visits generally declines with each successive age group. Children ages 15-17 comprise around 15 percent of total pediatric ED visits (see Appendix Table 1).

- *Medicaid is the principal payer for just over 2/3rds of pediatric visits.*

Medicaid was the principal payer for pediatric ED visits, paying for 68 percent (about 1.2 million) of all pediatric visits. Commercial payers were the second-highest payer at just over 20 percent (see Appendix Table 1).

Emergency Department Utilization Report 2018

Figure 1. Pediatric ED Visits by Sex, Race/Ethnicity, Age Group, and Payer Group

- *Young and middle aged adults made over half of all ED visits for 2018.*

Adults aged 18-54 accounted for 58 percent of all ED adult visits. The number of ED visits for women was approximately 13 percent higher than the number of visits by men. Medicare and Medicaid paid for half of the total number of adult ED visits (see Appendix Table 2).

Figure 2. Adult ED Visits by Sex, Race/Ethnicity, Age Group, and Payer Group

Volume Trends over Time

Due in part to population growth, the volume of ED visits for all payers has historically shown an annual increase. For 2018 the percentage of visits made by patients who were self-insured or under-insured was relatively static and the percentage of visits paid by commercial insurance and Medicare were almost equal.

Emergency Department Utilization Report 2018

Figure 3 shows the share of ED visits by payer group over the past five years. The general trend is that the overall volume of ED visits grows from year to year while the proportions for many payer groups stay relatively constant. However, calendar year 2018 marked a modest decline in the number of Medicaid claims for ED visits.

Figure 3. Total Visits by Payer Group 2015-2018

Inpatient Hospitalization

In 2018, Florida EDs saw 10,892,963 ED visits with 1,848,128 (17 percent) of those visits subsequently resulting in a hospital inpatient admission. Inpatient hospitalizations resulted from 61,653 pediatric visits and 1,786,475 adult visits. The inpatient hospitalization rate for pediatric visits was 3.4 percent, while the rate for adult visits was 19.74 percent.

- *Pediatric ED visits are less likely to result in inpatient hospitalization than adult visits.*

Regardless of patient characteristics, the rate of pediatric ED visits resulting in inpatient hospitalization was much lower than the rate for adult ED visits (see Appendix Table 3).

- *Charity, self, and under-insured paid visits were less likely to be admitted for inpatient care than government programs or commercial payers for pediatric visits.*

Pediatric ED visits with Medicaid, Medicare, other government, or commercial principal payers resulted in inpatient hospitalization ranging from 3 percent for Medicaid to a high of 4.8 percent of Commercial patients. In contrast, only 2.4 percent of charity and 1.9 percent of self or under-insured pediatric visits were admitted for inpatient care. These rates are well below the statewide average of 3.4 percent pediatric ED visits resulting in hospitalization (see Appendix Table 3).

Figure 4. Inpatient Hospitalization Rate for Pediatric ED Visits by Patient Characteristics

- *Patient age is related with an inpatient hospitalization following an ED visit.*

Patients over 80 years of age who visit EDs are more likely to be hospitalized for their conditions (see Appendix Table 3). This phenomenon is likely attributable to the types of health concerns that bring older patients to the ED. Eight of the ten most frequent medical conditions for overall inpatient hospitalization, such as heart and lung disease, are among the most common conditions for patients over 65. Visits paid by Medicare are approximately twice as likely to result in inpatient hospitalization as other payers, possibly because patients over 65 years of age are also more likely to have Medicare coverage.

Figure 5. Inpatient Hospitalization Rate for Adult ED Visits by Patient Characteristics

Patient Acuity

The Agency's outpatient ED database collects Current Procedural Terminology (CPT) Evaluation and Management codes, designed to categorize the acuity (severity) of a patient's diagnosis. The following analysis used these CPT codes to label outpatient visits as either high acuity or low acuity visits.¹

- *Pediatric visits for young children were more likely to be low acuity visits.*

The rate of low acuity visits for children below five years of age was about 10 percent higher than the low acuity rate for children aged 15-17 (see Appendix Table 4). Low acuity rates decrease for every increase in age group for pediatric visits.

¹ For a full definition of patient acuity, see Appendix page 22, "Definition of Patient Acuity."

Figure 6. Low Acuity Rate for Pediatric Outpatient ED Visits by Patient Characteristics

- Average charges for pediatric visits increase with age.

For both low and high acuity visits, the average charge for a pediatric visit was much higher for the older age groups. The average low acuity charge for those aged 15-17 was \$1,316 while the average low acuity pediatric ED visit for those under age 5 was \$1,057. The average high acuity charge for ages 15-17 was \$5,041 dollars, nearly double the average cost for a high acuity visit for those under age 5 at \$2,639 (see Appendix Table 4).

Figure 7. Charges for Pediatric ED Outpatient Visits by Acuity and Patient Characteristics

- Low acuity ED visits by adults were more likely to be the youngest and oldest adults, but the low acuity visits by adults aged 65-74 were costlier.

The low acuity rate for 18-34 year old patients was 11.8 percent and 11.26 percent for adults aged 80 and over. The low acuity rate for middle aged adults lower was ranging from 7.3 to 9.4 percent. The

Emergency Department Utilization Report 2018

highest mean charge for low acuity ED visits by adults was for those aged 65-79 was \$1,722 while the average charge for those aged 80+ was lower at \$1,312 (see Appendix Table 5).

Figure 8. Low Acuity Rate for Adult ED Outpatient Visits by Patient Characteristics

- *Average charges for high acuity adult visits were higher for adults aged 65-74.*

For high acuity ED visits the average charge generally increased with age, but for calendar year 2018 the oldest adults did not have the most costly high acuity ED visits. The average high acuity visit for a patient over 80 years of age (\$8,953) cost, on average, \$1,403 dollars less than a high acuity visit for a patient aged 65-79 (\$10,356). The average cost for a high acuity ED visit was \$9,568 for patients aged 55-64 and this amount is also higher than the average cost for an adult aged 80+ (see Appendix Table 5).

Figure 9. Low Acuity Rate for Adult ED Outpatient Visits by Patient Characteristics

Acuity Trends over Time

The number of ED visits per capita in Florida has increased during the past decade.² Figure 10 shows that ED visits per 1,000 population have generally risen since 2008. Although EDs are seeing more patients, the majority of visits are considered high acuity visits.

As seen in Figure 10 below, the low acuity visit rate per 1,000 population for ED visits has decreased by almost 50 percent since 2008. Figure 11 shows that the percentage of Floridians who lack health insurance declined after 2012 and has remained stable at around 13 percent over the past three years.³

² Unless otherwise noted, all analysis in this report examines the full dataset of ED visits in 2018. In order to maintain comparability with previous years' reports, the "Acuity Trends over Time" and "Volume Trends Over Time" sections examine only the ED visits made by Florida residents.

³ The trend in uninsured rates in Florida is consistent with a nationwide increase in health insurance coverage rates. Source: <https://census.gov/library/publications/2019/demo/p60-267.html>

Top Medical Conditions

The following tables show the overall most commonly diagnosed medical conditions for outpatient ED visits (Figure 12) and ED visits that resulted in hospitalization (Figure 13). The tables also show the average charge for each condition. For a breakdown of top pediatric/adult conditions, see Appendix Tables 6-9.

Emergency Department Utilization Report 2018

Figure 12. Top Ten Most Common Medical Conditions for Outpatient Visits

Outpatient Diagnosis	Percentage of ED Visits	Mean Charges
Other upper respiratory infections	6.27%	\$2,772
Abdominal pain	4.86%	\$10,506
Superficial injury; contusion	4.71%	\$5,450
Nonspecific chest pain	4.60%	\$13,747
Sprains and strains	4.32%	\$5,167
Spondylosis; intervertebral disc disorders; other back problems	3.81%	\$6,215
Urinary tract infections	2.90%	\$7,598
Skin and subcutaneous tissue infections	2.70%	\$3,635
Open wounds of extremities	2.69%	\$3,729
Other injuries and conditions due to external causes	2.63%	\$6,629

Figure 13. Top Ten Most Common Medical Conditions for Inpatient Hospitalizations

Inpatient Diagnosis	Percentage of Hospitalizations	Mean Charges
Septicemia (except in labor)	9.02%	\$105,475
Hypertension with complications and secondary hypertension	5.41%	\$65,797
Pneumonia (except that caused by tuberculosis or sexually transmitted disease)	3.12%	\$55,504
Cardiac dysrhythmias	3.12%	\$60,708
Chronic obstructive pulmonary disease and bronchiectasis	2.93%	\$48,716
Acute and unspecified renal failure	2.68%	\$54,398
Acute cerebrovascular disease	2.63%	\$104,178
Acute myocardial infarction	2.63%	\$131,819
Skin and subcutaneous tissue infections	2.60%	\$40,739
Diabetes mellitus with complications	2.58%	\$65,790

Geographic Variation in ED Use

Figure 14 shows the number of ED visits per 1,000 people in each county in Florida⁴ (see Appendix Tables 10-11 for details). Visits are classified by the county of residence for each patient, not the county in which the facility is located. If a patient lives in Nassau County but visits an ED in neighboring Duval County, for example, the visit is classified as a Nassau County visit.

Other upper respiratory infections	4.23%	\$3,338
Urinary tract infections	3.22%	\$8,041
Other complications of pregnancy	3.11%	\$5,287
Skin and subcutaneous tissue infections	2.85%	\$3,917
Open wounds of extremities	2.84%	\$3,909

Table 9. Top Ten Most Common Medical Conditions for Adult Inpatient Hospitalizations

Inpatient Adult Diagnosis	Percentage of Adult Hospitalizations	Mean Charges
Septicemia (except in labor)	9.27%	\$105,489
Hypertension with complications and secondary hypertension	5.60%	\$65,798
Cardiac dysrhythmias	3.22%	\$60,789
Chronic obstructive pulmonary disease and bronchiectasis	3.03%	\$48,687
Pneumonia (except that caused by tuberculosis or sexually transmitted disease)	3.01%	\$57,126
Acute and unspecified renal failure	2.77%	\$54,367
Acute myocardial infarction	2.72%	\$131,819
Acute cerebrovascular disease	2.72%	\$104,066
Skin and subcutaneous tissue infections	2.59%	\$41,436
Diabetes mellitus with complications	2.58%	\$67,157

Emergency Department Utilization Report 2018

Table 10. ED Visits per 1,000 Population by County

County Name	Visits per 1,000	County Name	Visits per 1,000
Alachua	507.6	Lee	407.0
Baker	601.9	Leon	452.8
Bay	583.6	Levy	518.4
Bradford	713.4	Liberty	632.3

Definition of Patient Acuity

The following CPT codes are used to report evaluation and management services provided in the ED. No distinction is made between new and established patients in the emergency department. CPT codes are a Copyright of the 2016 American Medical Association. All rights reserved. CPT is a registered trademark of the American Medical Association.

Low Acuity

99281(G0380) - Emergency department visit for the evaluation and management of a patient, which requires these three key components: a problem focused history; a problem focused examination; and a straightforward medical decision-making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually the presenting problems(s) are self-limited or minor.

99282(G0381) - Emergency department visit for the evaluation and management of a patient, which requires these three key components: an expanded problem focused history; an expanded problem focused examination; medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually the presenting problem(s) are of low to moderate severity.

High Acuity

99283(G0382) - Emergency department visit for the evaluation and management of a patient, which requires these three key components: an expanded problem focused history; an expanded problem focused examination; medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually the presenting problem(s) are of moderate severity.

99284(G0383) - Emergency department visit for the evaluation and management of a patient, which requires these three key components: a detailed history; a detailed examination; and a medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problems are of high severity and require urgent evaluation by the physician but do not pose an immediate significant threat to life or physiologic function.

99285(G0384) - Emergency department visit for the evaluation and management of a patient, which requires these three key components within the constraints imposed by the urgency of the patient's clinical condition and/or mental status: a comprehensive history; a comprehensive examination; medical decision-making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problems(s) are of high severity and pose an immediate threat to life or physiologic function.
